

2007 West Virginia State University Research Plan of Work

Brief Summary about Plan of Work

West Virginia State University (WVSU) began the reactivation of its research programs in FY 2000. The Department of Land-Grant Programs was officially established on March 17, 2000 to serve as the land-grant administrative and operational entity of the University. This Department was later elevated to a Division of Agricultural, Consumer, Environmental, and Outreach Programs (or Division of ACEOP) in 2003. More recently, on March 15, 2006, the Division became "The Gus R. Douglass Land-Grant Institute" to better accommodate the growth of this unit and to better serve the University's constituents. The mission of this unit remains that of delivering the institution's land-grant mission related to the dissemination of research, teaching, and extension services to the state's citizens.

As it relates to financial support, formula funds for FY 2005 devoted to research programming were maintained at slightly over \$1 M. Prior to FY 2006, the University had received in two occasions, direct state appropriated dollars to meet the matching of its formula funding as the State Legislature recognized the need for the University's state match as a means to preserve the level of Federal funding coming into the State. This year, the State Legislature not only appropriated state dollars to meet the 90% match (FY 06), but also secured a line item within the institution's budget to meet the match thereafter. As state appropriations and other federal and non-federal funding are attained, the University assesses its position to extend its research and extension services to additional counties in the state. In only 5 years of service, many of these research programs have already had a profound impact on individuals and communities served.

The research plan of work for West Virginia State University focuses on plant genomics, environmental microbiology and remediation, aquaculture, and biotechnology. The University has a diverse group of research scientists with expertise in the fields of analytical chemistry, genetics, nutrition, and microbiology. The research addresses several challenges to the agriculture and energy industries. The strengths of the program for the past five years have been agricultural waste management and microbiology. This five year plan will include some aspects of the previous plan, however the primary focus is now on plant genomics. Research scientists have obtained several external equipment grants and over the past two years have gathered the necessary infrastructure, including three DNA sequencers, to move forward with planned genomics research. Facilities include several on campus analytical laboratories, an aquaculture facility, off-campus laboratories, two greenhouses, and a pilot plant anaerobic digester. Currently two scientists have full-time research appointments and six scientists are supported part-time. West Virginia State University recently obtained accreditation for an MS program in biotechnology. This has allowed the research program to support graduate assistants and has benefited the research scientists by providing technical and research capacity that did not exist at the university prior to the inception of graduate programs.

West Virginia University and West Virginia State University entered into a voluntary agreement in 1997 to create the West Virginia Association of Land-Grant Institutions; a collaboration of the state's two land-grant institutions committed to providing education that would help the citizens of West Virginia improve their lives and communities.

More recently (in 2005), triggered by an USDA-CSREES mandate, the two Universities developed a Comprehensive Plan for the State which superseded the former agreement. This plan assures appropriate coordination between the two institutions to avoid duplication of efforts, as it relates to their research and extension programming, and thus an efficient investment of human and financial resources within the State. Therefore, research at West Virginia State University is coordinated with the West Virginia Experiment Station. Supporting research at West Virginia University focuses on economic activities for which West Virginia conditions provide competitive advantage for producers and on problems having particular impact on families and communities within the state.

Estimated number of professional FTEs/SYs to be budgeted for this plan.

2011	0.0	0.0	0.0	14.8

Merit Review Process

The merit review process that will be employed during the 5-Year Plan of Work cycle

- Combined External and Internal University External Non-University Panel

Brief explanation

Each year, during the months of March and April, all programs are subjected to a review process. The process includes an internal and external evaluation. An oral presentation at the WVSC Annual Research Symposium is a key component of the overall annual evaluation and it is required for land-grant sponsored researchers. Stakeholders identified by the procedures outlined below are invited to the Symposium. The internal evaluation consists of an Office and/or Departmental appraisal by the executive staff. Additionally, all participants in land-grant sponsored research critically assess the research of fellow colleagues for developmental purposes.

A research advisory panel conducts the external program evaluations. The research advisory panel consists of local scientists with a wide variety of backgrounds, business leaders and other community members considered as suitable stakeholders for research programs. The evaluations from these panels are utilized to help rank and allocate funds to specific land-grant programs. Evaluation assessing research productivity versus resources spent will be included in the ranking of continuing projects to facilitate funding decisions during the next budget year or cycle.

Evaluation of Multis & Joint Activities

1. How will the planned programs address the critical issues of strategic importance, including those identified by the stakeholders?

The planned programs have been reviewed by internal and external panels. The external panel consists of professionals in the various fields addressed by the research programs. These and other stakeholders identify issues of importance in West Virginia. The research programs have been modified to address these relevant issues in the state. Research scientists also cultivate links to individuals, institutions, and organizations and use feedback to tailor their projects to specific needs expressed by stakeholders.

2. How will the planned programs address the needs of under-served and under-represented populations of the State(s)?

West Virginia has historically been an economically depressed state. Many of the citizens can be considered under-served and under-represented. Landowners are especially a focus of research programs. Environmental issues relating to mineral extraction and water quality are addressed by the research programs. Small farms will benefit from plant genomics research to improve insect and disease resistance of vegetable crops, potentially reducing input cost and improving yield. Waste management of animal manures is an issue facing several small and medium size farms in the state. The environmental microbiology program characterizes the potential impact of these wastes on well and stream water quality. This is especially important to rural residents that don't have access to a municipal water source.

3. How will the planned programs describe the expected outcomes and impacts?

The expected impact of this research on the state will be measured by the impact of each individual project. These are all long term programs, with both short-term and long-term outcomes. It is expected that each program will result in a measurable impact to the identified stakeholders. While some research projects within each program are very fundamental and may only result in advancing research tools or techniques, others will have an impact on government regulatory agencies, private businesses, and individual citizens within the state and/or region.

4. How will the planned programs result in improved program effectiveness and/or efficiency?

The research programs at West Virginia State University continue to evolve based on the outputs and outcomes measured for past programs. The research administrative unit, continuously reviews all projects within the program areas. The projects and programs that progress and produce yearly outputs and demonstrate the potential for longer term outcomes have been selected for further funding in this current plan of work.

Stakeholder Input

1. Actions taken to seek stakeholder input that encourages their participation (Check all that apply)

- Targeted invitation to traditional stakeholder groups
- Targeted invitation to non-traditional stakeholder groups
- Targeted invitation to traditional stakeholder individuals
- Targeted invitation to non-traditional stakeholder individuals

Brief explanation.

Individuals that are potential stakeholders are invited to participate on a review panel to evaluate the programs. Research administrators and research scientists seek individuals and groups within a specific area of expertise or understanding to provide input and shape the direction of the research programs in order to better address the needs of those individuals or groups. Several collaborations have been formed as a result of these activities. Traditional stakeholder groups include industry, departments of agriculture, and individual farmers. Non-traditional groups include non-profit environmental organizations, alternative energy groups and cooperatives, and under-served landowners who have been impacted by mineral extraction.

2(A). A brief statement of the process that will be used by the recipient institution to identify individuals and groups stakeholders and to collect input from them

1. Method to identify individuals and groups

- Use Advisory Committees
- Other (Researcher Interactions)

Brief explanation.

The research advisory committee consists of several individuals representing the different areas addressed by the programs. These individuals advise the scientists on possible stakeholders and issues important to those stakeholders. The individual research scientists attend professional seminars, special interest meetings and other relevant conferences and have identified stakeholders through interactions with groups or individuals interested in the research.

2(B). A brief statement of the process that will be used by the recipient institution to identify individuals and groups stakeholders and to collect input from them

1. Methods for collecting Stakeholder Input

- Meeting with traditional Stakeholder groups
- Meeting with traditional Stakeholder individuals
- Meeting specifically with non-traditional groups

Brief explanation

Stakeholder input is collected during meetings and interactions with groups and individuals interested in the research programs. Non-traditional groups as well as traditional groups contact the University periodically and input from these individuals is gathered and used to assist the scientist in strengthening the program to better meet the needs and interests of stakeholders.

3. A statement of how the input will be considered

- To Identify Emerging Issues
- Redirect Research Programs
- In the Staff Hiring Process
- To Set Priorities

Brief explanation.

Stakeholder input is necessary to maintain the relevance of the research program. Emerging issues in a specific field may redirect the program or eliminate the need for a specific project within the program. Staffing for particular programs is based in part on the need and importance of that project or program to stakeholders.

1. Name of the Planned Program

Natural Resource Management

2. Program knowledge areas

- 133 Pollution Prevention and Mitigation 100 %

3. Program existence

- Intermediate (One to five years)

4. Program duration

- Medium Term (One to five years)

5. Brief summary about Planned Program

This program contains two research projects. The first will develop metal-ion binding technology for use in waters contaminated with heavy metals. Metal-ion presence or contamination in water sources is a world-wide problem whose solution has received considerable attention. A common method of removal of the metals from water involves the complexation of the metal ions with soluble ligands such as EDTA, a homogenous method. The metal-ligand complex then has to be removed from the water. The goal of this research is to develop water-soluble ligands that are supported by an insoluble inorganic support, such as alumina or silica. The major advantages sought here include, the use of high concentrations of ligands thus significantly increasing the capacity for metal complexation, and the ease of disposal of the supported ligand-metal complex from water. The second project assess photo-initiated, supra-molecular, heterogeneous catalyst technology for its capacity to sequester carbon, while producing methane and methanol. Reduction of carbon dioxide is a critical environmental issue. A key component to this research is carbon sequestration and recycling. This second project addresses the capturing of carbon dioxide. However, it takes it a step further in the attempt to minimize environmental and geological impact. Not only does this project capture carbon dioxide, it will utilize solar energy to convert it into a useful fuel or a chemical feedstock. Instead of disposing of carbon dioxide waste into a geological landfill, carbon dioxide will be recycled using a free and natural energy source. Both of these research projects address environmental issues important to the state of West Virginia. Related research at West Virginia University will involve either soil or water quality and will examine the impact of human activity on both.

6. Situation and priorities

Natural resources research at West Virginia State University addresses the remediation of current threats to the states air and water. Metal contamination of water sources in the environment is an issue receiving intense, worldwide attention. Waterways from areas receiving drainage associated with deep or surface mining can contain high levels of metals, which can damage or eliminate aquatic life and render the water useless for agriculture or recreation. This research will develop metal-ion binding technology for use in waters contaminated with heavy metals. Industrial activity in the past century has resulted in a 50% increase in atmospheric carbon dioxide (CO₂). Carbon dioxide can be converted into methane or methanol, having a two-fold result: (1) minimizing environmentally damaging chemicals and (2) creating new energy sources. However, due to the high over-potential needed, carbon dioxide reduction via electrochemical methods is not cost effective. An alternative is to model systems after nature's efficient photosynthetic pathways to circumvent this problem. This research will assess photo-initiated, supra-molecular, heterogeneous catalyst technology for its capacity to sequester carbon, while producing methane and methanol.

7. Assumptions made for the Program

This research program is supported by both CSREES and external funding. The scientists conducting research have specific knowledge of analytical chemistry techniques and operation of specialized experimental and analytical equipment necessary to conduct this research. Currently, WVSU provides laboratories and equipment to support this research program. Both extraction and end use of coal are important to the economy of West Virginia. With worldwide energy demand increasing, the price and demand for coal has sharply increased. Associated with more extraction of coal from surface and deep mines is the release of metals into the waterways. At the time of combustion, usually for industrial processes or electrical generation, carbon dioxide is released. This has resulted in rising carbon dioxide levels in the atmosphere, contributing to global warming. This research program addresses these issues. Local, state, and federal groups and agencies may be able to use the findings of this research to maintain current production levels while lessening the impact on the air and water quality of West Virginia.

8. Ultimate goal(s) of this Program

The ultimate goals of the program include: 1. Improve water quality - Develop metal-ion binding technology to remediate contaminated water - Identify and quantify specific heavy metals in WV waterways 2. Carbon Sequestration - Reduce carbon dioxide emissions - Produce alternative energy sources

9. Scope of Program

- In-State Research

Inputs for the Program

10. Expending formula funds or state-matching funds

- Yes

11. Expending other than formula funds or state-matching funds

- Yes

12. Expending amount of professional FTE/SYs to be budgeted for this Program

1. Name of the Planned Program

Aquaculture

2. Program knowledge areas

- 307 Animal Management Systems 25 %
- 302 Nutrient Utilization in Animals 75 %

3. Program existence

- Intermediate (One to five years)

4. Program duration

- Medium Term (One to five years)

5. Brief summary about Planned Program

This research program will focus on cool water fish that have the potential to be grown and marketed in West Virginia. Availability of clean, fresh cool water from inactive deep coal mines in southern West Virginia make this region appropriate for the development of aquaculture. This program will evaluate the levels of nitrogen and phosphorus in aquaculture waste water and methods to reduce those levels and determine the feasibility of using agricultural and municipal waste as a feed source to reduce protein costs in aquaculture diets.

6. Situation and priorities

Today, aquaculture accounts for around 15% of total worldwide production of fish and seafood with 20 million tons of edible seafood coming from fish farmers. According to the World Aquaculture Association, aquaculture will have to play an increasingly important role in meeting the global demand for fisheries products as the world population continues to expand and fisheries stocks approach their biological limits. The availability of freshwater and the proximity to large population bases, along with the increased demand for fresh fish, make aquaculture a promising agriculture industry in West Virginia. While promising, aquaculture does face several economic and environmental issues. Fish require high protein diets for optimal growth. Much of the protein is from animal sources and is expensive in comparison to other sources of protein. The cost of feed for aquaculture operations is the greatest operating expense. By replacing animal proteins with proteins from waste materials, the total cost of the feed can be reduced, resulting in higher profit margins for growers. Nitrogen and phosphorus discharge from aquaculture operations can impair nearby waterways, and result in discharge fees or fines for the operation. More effective feeding strategies and better formulated diets can help reduce the amount to nitrogen and phosphorus in aquaculture discharge waters.

7. Assumptions made for the Program

This program has been supported by CSREES and external grants. The scientist conducting research has experience with cool water species, such as trout, and ration formulation. WVSU has provided on campus laboratories and equipment for this program. Currently the state of the aquaculture industry in West Virginia is still in development. This program will help address some of the issues preventing commercialization of aquaculture in southern West Virginia.

8. Ultimate goal(s) of this Program

1. Ration formulation - reduce feed costs - reduce nitrogen and phosphorus discharge into waterways
2. Protein replacement - reduce feed costs

9. Scope of Program

- In-State Research

- 403 Waste Disposal, Recycling, and Reuse 75 %

3. Program existence

- Intermediate (One to five years)

4. Program duration

- Medium Term (One to five years)

5. Brief summary about Planned Program

This research program consists of two different investigations using similar molecular techniques. Projects within this program include: 1. Characterization of antibiotic resistant bacteria in poultry manure. 2. Anaerobic bacteria from a digester will be characterized in order to define the digester genomics and community structure.

6. Situation and priorities

Anaerobic digester technology for waste management is becoming a more attractive option for adding value to animal manure and improving nutrient management of associated nitrogen and phosphorus. The function of digesters requires the cooperation of complex consortia of bacteria. The quantitative detection of key populations is needed in order to develop predictive models for digester control. WVSU has been operating a pilot-plant digester for six years on campus. Material from this unit is being used to conduct small scale reactor experiments. The bacterial consortium under specific operating conditions is being characterized in order to create a profile for future reference. In addition, the heavy use of antibiotics on poultry is a well known problem that may contribute to the spread of antibiotic resistant human pathogens. Development of reliable real-time PCR techniques to identify and quantify bacterial populations and identification of antibiotic resistant microbes in poultry litter is the focus of microbiology research at WVSU.

7. Assumptions made for the Program

The program is using facilities and equipment on the campus of WVSU, including a 40 cubic meter anaerobic digester pilot plant, a 30 liter lab scale digester, and two laboratories. One research scientist, a PhD candidate and several undergraduate and graduate students are currently working on projects within this program. The program receives partial funding from CSREES formula funds, with most of the funding from external grants. The scientist and students have extensive knowledge of molecular DNA techniques and the characterization of anaerobic bacteria.

8. Ultimate goal(s) of this Program

1. Anaerobic bacteria characterization - Develop a profile of bacteria that can be used as a monitoring tool for anaerobic digester operators and engineers. 2. Antibiotic resistant bacteria - Determine the species and extent of antibiotic resistant bacteria in poultry manure to determine if a change in antibiotic use in poultry is necessary to prevent human health problems.

1. Name of the Planned Program

Plant Genomics

2. Program knowledge areas

- 204 Plant Product Quality and Utility (Preharvest) 15 %
- 201 Plant Genome, Genetics, and Genetic Mechanisms 50 %
- 202 Plant Genetic Resources 35 %

3. Program existence

- Intermediate (One to five years)

4. Program duration

- Long-Term (More than five years)

5. Brief summary about Planned Program

This research program consists of two projects already in progress. A hydroponic tomato breeding project and a pepper, sweet potato, and watermelon gene mapping project will be continued. Each project involves investigation of genetic markers for insect and disease resistance, superior yield, and superior quality of harvested product. The greenhouse hydroponic research focuses on developing new lines of tomatoes especially for North American production systems. The pepper and watermelon research focuses on mapping specific traits using DNA marker technology. Related research at West Virginia University will focus on determining the function of ubiquitin and other polypeptide tags, to understand mechanisms of flower senescence.

6. Situation and priorities

The application of DNA marker technology for genetic improvement of pepper and watermelon is essential for genetic mapping and for gene manipulation. A gene mapping project focuses on building extensive genomic resources for these crops and identifying germplasm with disease and pest resistant genes. Currently, most of the varieties used in greenhouse hydroponic tomato production are bred for northern European conditions and palate. Even though these plants are grown in North American greenhouses, the European environment selects for plants with a lower light requirement in the winter and a more moderate temperature year round than is found in North America. Thus, while these varieties can produce a crop under our conditions, they are not selected for the North American greenhouse environment or our consumer needs. This research will develop lines suitable for North American production systems.

7. Assumptions made for the Program

Three research scientist will conduct this research with support from CSREES and external grant funding. These scientists will be assisted by graduate students, technicians, and post doctorate researchers, all with specific knowledge regarding molecular genetics techniques and equipment. Several laboratories, two greenhouses, and an on campus field station have been wholly or partially committed to this program.

8. Ultimate goal(s) of this Program

- Develop a greenhouse beefsteak tomato variety for southern greenhouse tomato producers - Build extensive genomic resources for these crops and identify diverse germplasm with pest/disease resistant and nutraceutical genes.

9. Scope of Program

- In-State Research
- Multistate Research

Inputs for the Program

Agricultural Biotechnology

2. Program knowledge areas

- 206 Basic Plant Biology 100 %

3. Program existence

- New (One year or less)

4. Program duration

- Medium Term (One to five years)

5. Brief summary about Planned Program

This program involves fundamental research in biochemistry of proteins of agronomic importance. The initial studies will focus on Rubisco (the carbon dioxide fixing enzyme in photosynthesis). Novel information on structure function relationships of Rubisco could be used to increase the yield of numerous crops. The initial project includes cloning, expressing, isolating and characterizing Rubisco, understanding the dynamics of protein on substrate specificity and catalysis, identifying the critical protein sequence on activity, and creating and characterize novel Rubisco.

6. Situation and priorities

Rubisco plays an important role in agricultural productivity, so there has been much interest to create an enzyme with an increase in efficiency of carboxylation. The Rubisco is hexadecameric enzyme with eight large subunits and eight small subunits. Functional unit constitute two 55 kDa large subunits assemble into functional dimers with two active sites. Where as four 15 kDa small subunits cap the top and bottom of four pairs of the large subunits to form the hexadecameric holoenzyme. On the other hand, prokaryotic rubisco are dimeric large subunits, which lack smaller subunits. Rubisco from various sources shows structural identity. The X- ray structural data and mutational studies alone are not sufficient for elucidating the mechanism that brings about the observed changes during catalysis. So it is worthy to study dynamics of Rubisco by HPLC-MS-ESI-H/D exchange of amide proton experiments to identify critical structural changes occurring during substrate binding and catalysis, thus generating a superior Rubisco.

7. Assumptions made for the Program

The research scientist will conduct this research with support from CSREES and external grant funds. Scientist will be assisted by graduate students, technicians, and post doctorate researchers, all with special knowledge regarding biochemical and proteomic techniques and equipment.

8. Ultimate goal(s) of this Program

Develop a superior quality Rubisco for photosynthetic plants thus increasing their productivity.

9. Scope of Program

- In-State Research
- Multistate Research

Inputs for the Program

10. Expending formula funds or state-matching funds

- Yes

11. Expending other then formula funds or state-matching funds

- Yes

Alternative Agriculture

2. Program knowledge areas

- 201 Plant Genome, Genetics, and Genetic Mechanisms 25 %
- 205 Plant Management Systems 75 %

3. Program existence

- Intermediate (One to five years)

4. Program duration

- Medium Term (One to five years)

5. Brief summary about Planned Program

This research program consists of one project already in progress. This work will have three production foci: hydroponic, organic/sustainable and ornamental. Each of these foci may involve varietal selection; germplasm characterization and evaluation; nutrient and pest management; soil/media quality and plant performance; production practices and postharvest quality; and production practices to improve plant systems. The overall objective of this project is to develop and demonstrate hydroponic, sustainable/organic and ornamental technology and/or production systems suitable for use by small producers.

6. Situation and priorities

Alternative agriculture products and practices such as organic farming and hydroponic systems are becoming an important component in North American agriculture. Alternative approaches to growing traditional crops, and the production of new or exotic species not currently grown on a large-scale commercial basis in the USA, can provide a greater return on small farm investment compared to traditional products and practices. In areas such as southern West Virginia, with economic instability due to the transition from an industrial and forestry based economy to a service and technology based economy, income from small farms could provide an important source of income for landowners in these regions. Other potential areas of alternative production include organic farming, ornamental and herb production, and hydroponic plant production.

7. Assumptions made for the Program

One research scientist will conduct this research with support from CSREES and external grant funding. This scientist will be assisted by undergraduate students, graduate students, and technicians, all with specific knowledge regarding horticultural production and management. Research projects will be conducted in laboratories, greenhouse facilities, and an on campus field station.

8. Ultimate goal(s) of this Program

Develop and demonstrate hydroponic, sustainable/organic and ornamental technology and/or production systems suitable for use by small producers.
